Factory 1 of AMC-MECANOCAUCHO

Factory 2 of AMC-MECANOCAUCHO

Factory of **sylomer®** in Austria.

**sylomer®** by getzner

**Akustik+Sylomer®** is the trademark of a new solution for the anti-vibration mountings of false ceilings or vibrating elements that have to be suspended. They are used for the attenuation of vibrations, reducing structure-borne noise.

**AMC-MECANOCAUCHO®** has been manufacturing anti-vibration suspensions since 1969, and since then it has been manufacturing suspensions for this same purpose, using rubber, spring or a combination of both, called **Akustik**.

**GETZNER Werkstoffe GmbH** manufactures a prestigious anti-vibration material called **Sylomer®** whose main application has been the isolation of vibrations produced by railways. Operating from Austria since 1969, it is now the leader in its sector, and boasts totally cutting-edge technological facilities and media for vibration isolation.

The **Akustik+Sylomer®** ceiling mounts are made of Sylomer®, a microcellular polyurethane material specially conceived for vibration isolation. This material produces a higher degree of damping than the elastomers traditionally used for this purpose.

## ENGINEERING

## LOGISTICS

## ANTIVIBRATION CALCULATIONS

## EXPOSITION TOOLS FOR DISTRIBUTORS

# The cooperation of two great companies

## QUALITY

We have more than 45 years of experience providing quality products, capable of overcoming the most demanding tests. For this purpose it is vital our knowledge on the correct manufacturing processes and the use first grade components.

## SERVICE

We keep in stock more than 4,5 Million euros of finished products. This fact is key to respond quick to urgent enquiries.

## ENGINEERING SERVICES

Calculations • Development • Tests • Measurements

Our technical department makes calculations, develops new products, analyzes their elastical properties and make on site measurements in order to find the correct technical solution to solve each vibration problem.

## DISTRIBUTOR SUPPORT

AMC-MECANOCAUCHO offers a wide range of exposition displays on store. Should you require one, do not hesitate to contact our sales dpt, so they can offer you the one that adapts better to your needs.

## ACOUSTIC HANGERS

### BASIC INFORMATION ON STRUCTURAL ACOUSTICS

#### 1.-NOISE AND VIBRATION PROBLEMS IN PREMISES

Sound that is unpleasant to the human ear is known as noise, and ecologically speaking is a form of pollution that is becoming increasingly more widespread due to town and city development.

It could be defined as a vibratory phenomenon propagated in an elastic medium (ceilings, walls, floors and the air itself) causing perturbations in it. To isolate any premises or venue properly, the first step is to identify the composition and the values of the noise (spectrum of frequencies, noise level etc.).

Once we know the magnitude of the noise or the vibrations to be insulated, we must build an unconnected off-the-floor frame which gives us the insulating and dampening values we need.

#### 2.- BOX-IN-BOX Concept

The "box in box" concept consists of acoustically isolating a room by placing flexible elements between the structure of the building and the elements that can be seen and are in direct contact with people.

AMC-MECANOCAUCHO offers a wide range of mounts for noise and vibration isolation of floors, ceilings and walls. There are solutions available with rubber technology, Sylomer®, springs or a combination of them.

#### 3.- ANTI VIBRATION SOLUTIONS

##### A. RUBBER

Natural frequency between 10-15Hz.  
Effective in medium and high frequencies.  
Small static deflections. High dampening.

##### B. SYLOMER<sup>®</sup>

Natural frequency between 7-12Hz.  
Effective in medium and high frequencies.  
Very small static deflections.

##### C. SPRING

Natural frequency between 2-7Hz.  
Effective in low and medium frequencies.  
Large static deflections.  
Same static and dynamic behavior.  
Low dampening, excellent isolation.

## BASIC INFORMATION ON STRUCTURAL ACOUSTICS

### 4.- THE IMPORTANCE OF THE DYNAMIC FREQUENCY OF THE ANTIVIBRATION MOUNTS.

Real data are required to carry out a study and calculation of a premises.

The static stiffnesses that are provided by static load-deflection graphs are not valid for the calculation of a realistic insulation. Experience shows that the static calculations are very different from reality.

At the moment, AMC has a dynamic testing machine that can generate the most common types of vibration on premises, giving real frequency values, insulation, loss angle and critical dampening rate.

Dynamic testing machine

### 5.- INSTALLATION, 50% OF THE SOLUTION. OUR ADVICE: INSTALLATION OF PERIMETER SEAL.

The correct installation of these mounts is a critical factor to obtain optimal results of acoustical isolation. To achieve this, it is important to make a proper perimeter sealing, in order to avoid acoustic bridges that could lead to the transmission of noise through the walls.

# AKUSTIK+ AMC Mecanocaucho<sup>®</sup>

## ACOUSTIC HANGERS

### Akustik Range

A-45 Loads from 8 to 30 kg      B-60 Loads from 25 to 60 kg

Range designed for suspension of false acoustic ceilings and machinery operating at more than 1.000 r.p.m. The same vibration damping element which is used throughout the Akustik range is made of rubber of high mechanical performance; it is specially designed for vibration damping. The metallic structure is designed to resist loads up to 650 kg. It is supplied with an anti-corrosive zinc-plated coat.

#### Dynamic behaviour

To select correct mounting, following data are needed:

- Load per mounting (kg).
- Disturbing frequency (Hz).

Select correct load line in diagram 1 and refer to diagram 2 to obtain the Natural frequency. With this natural frequency prolong this line to the diagram 3 and obtain the % of isolation at the given Excitation Frequency (Hz).

VT-335 HD	335	GREY	50	20241
VT-446 HD	446	GREEN	50	20238

# ACOUSTIC HANGERS

## VT 3

### APPLICATIONS

The VT type 3 Low natural frequency acoustic hangers are produced as standard on 6 different stiffness coil springs to suit loads per point from 5 up to 150 Kg. The natural frequency on their optimal loading point ranges below 5 Hz. These technical properties provide a high level of noise and vibration isolation on light concrete structures. Their metal parts are coated to withstand corrosive environments.

They are typically installed every 1,5 linear meter. But this feature may be tuned in order to adapt to the load or natural frequency requirement of the application.

## TABIABSORBER

Delivery format: 1x1.25 meter layers

**EFFECTIVENESS:** Manufactured from CR (NEOPRENE<sup>®</sup>) particles and then compressed, the tabiabsorber can be furnished in two different versions depending on its use.

**VERSATILITY:** The TABIABSORBER can be furnished in two different versions depending on its use.

**EASY TO INSTALL:** Due to its exterior texture, the adherence to plaster, glue, concrete etc it is easily done thanks to its waterproofing.

**TABIABSORBER 5:** Shock absorber and noise isolator.

**TABIABSORBER 10:** Vibratory insulation.

We offer the cutting service upon requested dimensions.

When 2 dB at low frequencies  
make the difference

## COMPARATIVE TESTS AT THE LABEIN TECHNOLOGY CENTRE

**Akustik+Sylomer®** is de trademark of a new solution for the anti-vibration mountings of false ceilings or vibrating elements that have to be suspended. They are used for the attenuation of vibrations, reducing structure-borne noise.

The **Akustik+Sylomer®** ceiling mounts are made of Sylomer®, a microcellular polyurethane material specially conceived for vibration isolation. This material produces a higher degree of damping than the elastomers traditionally used for this purpose.

The **Labein** technology centre performed a series of comparative tests to confirm the good acoustic results of Akustik+Sylomer®. This centre is officially ENAC-certified and complies with the requirements of the ISO 140-1:1997 standard.

### PURPOSE OF THE TEST

The purpose of the test is to compare, in equal conditions, the acoustic isolation to air-borne noise of a false ceiling without anti-vibration suspensions (direct transmission) to a false ceiling with the new Akustik+Sylomer® suspensions.

The secondary endpoint is to compare the Akustik+Sylomer® to another suspension with the same size-specific characteristics using high-resilience natural rubber from our Akustik 4 45 shore A standard series.

### TEST METHODOLOGY

The reports contain the results of the noise isolation test to airborne noise conducted according to the UNE-EN ISO 140-3 standard for a false ceiling with the following ceiling mounts:

- Direct transmission (without antivibration suspensions).
- Akustik 4 45 shore A.
- Akustik 3 + Sylomer®30 Type B.

Besides the isolation curves, two RW and RA indexes have been calculated and used to compare the performance of the different suspensions. The RW noise reduction index of the sample tested and the terms of adaptation of the C and Ctr spectrum were obtained according to the ISO 717-1 standard, based on the isolation curve. The pink noise isolation index RA between 100Hz and 5 KHz is that which is specified by the Basic Spanish Building Standard: NBE-CA 88 "Acoustic Conditions".

Specimen used for the test

**IMPORTANT NOTE:** The composition of the false ceiling is not meant to be used for teaching purposes in acoustics. It is a standard implementation whose objective is to compare the anti-vibration elements. The specimen used in the tests is a standard ceramic pot slab with an airborne isolation of  $R_w(C, C_{tr})$ : 52 (0;-3) dB.

The results and the descriptive reports can be downloaded free of charge from [www.akustik.com](http://www.akustik.com)

## COMPARATIVE TESTS AT THE LABEIN TECHNOLOGY CENTRE

### COMPARATIVE RESULTS OF THE TEST BETWEEN A SUSPENDED CEILING WITH AND WITHOUT AKUSTIK+SYLOMER®.

Graphic 1 shows the isolation provided by a single plasterboard suspended with Akustik + Sylomer® suspensions and the same ceiling fitted with M6 rod. The blue line represents the isolation achieved with Akustik + Sylomer® mounts.

As can be seen, there are major differences at low and high frequencies, offering a difference of:

- 3 dB at 125 Hz
- 6 dB at 250 Hz
- 5 dB at 500 Hz
- 5 dB at 1000Hz

At the same time, comparative tests were conducted with ceilings with a greater number of plasterboards. Table 1 shows the results of the RW reduction index:

It is clear that the use of Akustik+Sylomer® suspensions provides far greater airborne isolations, which in some cases are equivalent to or greater than the use of 2 or 3 plasterboards with anti-vibration ceiling mounts.

**The results and descriptive reports can be downloaded free from [www.akustik.com](http://www.akustik.com)**

Akustik isolation curves

Graphic 1

Table 1

RW (C; Ctr) sound isolation index	Without suspensions (M6 rod)	With suspensions Akustik+Sylomer®
1 plasterboard	71 (-4; -10) dB	75 (-4; -10) dB
2 plasterboard	73 (-3; -9) dB	75 (-3; -8) dB
3 plasterboard	74 (-3; -8) dB	77 (-3; -8) dB

Gain in dB thanks to the use of the Akustik+Sylomer® suspensions as opposed to a ceiling without elastic suspensions.

## COMPARATIVE TESTS AT THE LABEIN TECHNOLOGY CENTRE

### COMPARATIVE RESULTS OF THE TEST BETWEEN A SUSPENDED CEILING WITH AKUSTIK+SYLOMER VS RUBBER SUSPENSIONS.

Table 2 compares the RA sound isolation index according to the number of plasterboards.

The improvement is self-evident, the akustik+sylomer® mounts offer a superior isolation to the rubber mounts. This difference is so great that it may be said that a ceiling with a plasterboard with akustik+sylomer® offers the same isolation as a ceiling with two plasterboard rubber suspensions. This therefore means savings in time and material.

The savings in plasterboard and labour costs make these mounts particularly interesting, both technically and economically.

In order to provide a better analysis of the differences between the rubber mounts and the akustik+sylomer® mounts, table 3 shows the isolation data at different frequencies.

The results of these tables show that the isolation differences are in the low frequency range, which is particularly interesting for the isolation of premises without soundproofing, since they are particularly difficult to isolate.

Table 2

RW sound isolation index	Akustik + sylomer®	RUBBER
1 plasterboard	75 (-4; -10) dB	74 (-3; -9) dB
2 plasterboard	75 (-3; -8) dB	75 dB (-4; -10) dB
3 plasterboard	77 (-3; -8) dB	76 (-4; -10) dB

Table 3

Suspended ceiling with 1 plasterboard		
FREQUENCY	Akustik + sylomer®	RUBBER
160 Hz.	58,3 dB	57,5 dB
250 Hz.	68,4 dB	66 dB
500 Hz.	80,3 dB	79,1 dB

False ceiling with 2 plasterboards

FREQUENCY	Akustik + sylomer®	RUBBER
160 Hz.	57 dB	56,9 dB
250 Hz.	70 dB	68 dB
500 Hz.	81,5 dB	81,1 dB

False ceiling with 3 plasterboards

FREQUENCY	Akustik + sylomer®	RUBBER
160 Hz.	60,4 dB	58,5 dB
250 Hz.	69,4 dB	67 dB
500 Hz.	82,4 dB	81,1 dB

## ADVANTAGES ON WOODEN STRUCTURES

In order to show the acoustic advantages when using Akustik+Sylomer® acoustic hangers, the German IFT Rosenheim technological center has performed Impact and airborne noise tests using 2 different types of wooden structures.

### IFT ROSENHEIM

Wooden ceiling using sand as a filler: Reduction of impact noise 19dB, Gain of airborne isolation 18 dB.

Wooden ceiling using mineral wool as a filler: Reduction of impact noise 14 dB, Gain of airborne isolation 6 dB.

In both kinds of ceilings a comparison has been done in order to determine the acoustic advantage that provides using Akustik+Sylomer® hangers.

Akustik Lateral+Sylomer®: The akustik Lateral hanger is specifically suiting the structures where no space is available and the acoustic hangers have to be fixed to the wooden beam.

The results and the descriptive reports can be downloaded free of charge from [www.akustik.com](http://www.akustik.com)

# AKUSTIK + sylomer® BEHAVIOUR AT HIGH AND LOW FREQUENCIES

Structure-borne noise is transmitted through the structures of a building, machine, installation... This radiation noise becomes airborne noise.

Low noise frequencies are those that are usually less damped in the air and are therefore better transmitted through structures. The range of low frequencies is between 20 and 500 Hz.

## NATURAL FREQUENCY OF THE AKUSTIK+SYLOMER® MOUNTS

The Akustik+Sylomer® ceiling mounts can obtain very low natural frequencies of up to 7 Hz at the optimal loading point. At this loading point the decoupling frequency of the Akustik+Sylomer® mounts is 9,9Hz.

Such a low natural frequency is optimal for the false ceilings of soundproofed premises. This type of suspensions are also particularly interesting for the isolation of machines or

vibrating elements that work at more than 600 rpm. Examples are:

- Ducts / pipelines:
  - Of cooling liquids from refrigerating compressors, and are ideal for use in supermarkets, the frozen food section.
  - Air conditioning.
  - Pumping of water
  - From fume exhausts.
- Suspension of air conditioning machinery.
- Suspension of vibrating elements in general.

## BEHAVIOUR OF THE AKUSTIK+SYLOMER® MOUNTS AT LOW FREQUENCIES IN SOUNDPROOFED PREMISES.

The range of audible frequencies in the human being may vary according to age and to other factors although in general it is between 20 Hz and 20.000Hz. By way of example the notes produced by a guitar have a frequency range from 82

to 698 Hz.

Considering that the most unfavourable excitation frequency, i.e. 20 Hz, the isolation degree of structure-borne noise produced by an Akustik+Sylomer® suspension would be close to 90%. (\*)

(\*) Installation of the optimal loading point of the Akustik+Sylomer® for a theoretical single mass spring system.

## BEHAVIOUR OF THE AKUSTIK+SYLOMER® MOUNTS AT MEDIUM AND HIGH FREQUENCIES.

Sound waves are not comprised of just one frequency, but rather of a set of frequencies superimposed without any order, which is the main reason why noise is unpleasant. Thus, the ideal suspender must be able to isolate the broadest possible range of frequencies.

### Behaviour of a metal spring

These suspenders are often recommended for the elastic

suspension of false ceilings. It is important to know that this type of mount is suitable for the damping of low frequencies, whereas the high frequencies are propagated through the coils of the spring. To filter this type of frequencies the springs must be combined with a stage of viscoelastic material under the spring to stop the propagation of this type of vibration.

## BEHAVIOUR OF THE AKUSTIK+ SYLOMER®

Thanks to the viscoelastic properties of the Sylomer, the akustik+Sylomer has a behaviour similar to the spring at low frequencies and at the same time not only prevents the high frequencies as occurs in the spring via its coils, but also considerably improves the behaviour of the rubber at high frequencies. These results are shown in the comparative section of Akustik+Sylomer® with regard to rubber suspenders.

## CREEPING AND LONG-TERM BEHAVIOUR

Static loads produce a certain degree of creeping. This phenomenon can be observed in all elastomers. Creeping is the increase in deformation under consistent loading Figs. 1 and 3 show the creeping for the two types of Sylomer® used for our ceiling mounts.

Within the field recommended for the application of continuous loads, the additional deflection remains under 50% of the initial deflection even after an extended period of 10 years.

The dynamic stiffness of the ceiling mounts must increase as little as possible over time. Figs. 2 and 4 show the variation of the dynamic module over time of the two types of Sylomer used in our ceiling mounts.

## Akustik+Sylomer®: Models and dimensions

### PRODUCT DESCRIPTION

These antivibration mounts have been conceived for the suspension of false ceilings, vibrating pipelines and machinery that has to be suspended.

The excellent properties of the Sylomer® micro-cellular polyurethane material achieve elevated isolation values as opposed to other mounts that use rubber or cork, or a combination of both. These antivibration mounts are manu-

factured in two special mixes of Sylomer® to adapt better to the load of each application.

A great variety of fixing metal armors and elements facilitate the installation and to adapt better to each type of job. Their rugged metal parts can withstand tensile stresses from 650Kg to 1000Kg. They are supplied with an anticorrosive treatment that can withstand the toughest environments.

	<b>Akustik 1</b>	<p>It is secured directly to the ceiling by means of two holes.</p>		
	<b>Akustik 3</b>	<p>It is secured directly to the ceiling with a screw and locking nut.</p>		
	<b>Akustik 4</b>	<p>It is secured with a screw via a nut welded to the metal armor.</p>		
	<b>Akustik 4 High</b>	<p>It is secured with a screw via a nut welded to the metal armor.</p>		
	<b>Akustik Rapid T47</b>	<p>Designed to be secured to most profiles on the market. Its design makes for easy and safe installations.</p>		
	<b>Akustik Safety</b>	<p>Its gravitational system guarantees correct installation and offers greater safety, preventing elements from becoming detached.</p>

### Akustik GB + Sylomer®

#### PRODUCT DESCRIPTION

These simple but effective acoustic hangers are designed for the installation of suspended ceilings, pipelines and machinery.

The Sylomer® microcellular polyurethane material provides superior isolation than rubber and/or cork materials and two versions are available depending on the load capacity required.

Type A is supplied with a rod to fix to a channel/bracket and Type B has an integrated nut for quick fixing of a suspension rod.

All metal parts have anti-corrosion zinc-plating.

# AKUSTIK + sylomer®<sup>by getzner</sup> INSTALLATION INSTRUCTIONS

INSTALLATION INSTRUCTIONS  
AVAILABLE ON THE QR CODE:

## Installation steps for Akustik Super

(Free technical support available upon request.)

1.- Fix threaded wall plugs to the ceiling.

3.- Attach the acoustic hangers to the end of the studbolt.

5.- Fix the profiles to the acoustic hangers.

7.- Lower the safety flanges into position.

2.- Screw studbolts into the treaded wall plugs.

4.- Level the hangers using a laser alignment tool.

6.- Profiles fixed in position.

8.- Install supplementary fixings (optional) to provide additional safety feature.

## ACOUSTIC HANGERS

Installation steps (Free technical support available upon request.)

9.- Acoustic hangers an profiles fixed.

10.- Place transverse profiles in position.

11.- Fix transverse profiles.

12.- Position plasterboards in place.

13.- Plasterboards fixed.

14.- Plasterboards fixed.

### MIN/MAX Distances (Type A)

## ACOUSTIC HANGERS

### SRS + Sylomer<sup>®</sup>: Models and dimensions

#### PRODUCT DESCRIPTION

These antivibration mounts have been conceived for the suspension of suspended ceilings or machines that rotate at low frequency. The excellent properties of the Sylomer<sup>®</sup> microcellular polyurethane combined with the low stiffness of an steel spring achieve increased isolation values as opposed to other mounts using rubber or cork, or a combination of both.

These antivibration mounts are manufactured in 6 different steel spring models to adapt optimal for each application.

Their rugged metal parts withstand can tensile stresses. They are supplied with an anticorrosive treatment that can resist tensile stresses up to 1000Kg withstand the toughest environments.

## ACOUSTIC HANGERS

### ST + Sylomer®: Models and dimensions

#### PRODUCT DESCRIPTION

The AMC-MECANOCAUCHO® type ST+Sylomer® is ideal for high performance building acoustics as well as for stationary applications where the acoustic hanger must provide a high degree of structure borne noise isolation. Thanks to their low

stiffness they are capable of achieving natural frequencies ranging from 3 to 4Hz. Due to this fact they are often used on applications where a high isolation degree is required even at low disturbing frequencies (600 to 1000 rpm).

# ACOUSTIC WALL TIES

## EP+Sylomer®: Models and dimensions

### PRODUCT DESCRIPTION

Range designed for the floating suspension of soundproofed walls. Sylomer® avoids the transmission of vibrations while providing optimal acoustic results.

They have a "FAIL SAFE" rugged metal structure, which is overload-proof. Recommended for applications where fire or impact resistance is necessary.

These mounts are also suitable for the isolation of vertical pipes, or any type of lightweight ducts that need to be isolated.

**EP+Sylomer® Type B**

It is secured to the wall by means of two holes. It has a female M6 metal insert.

**EP + Sylomer Type A**

It is secured to the wall by means of two holes. It has a female M6 metal insert.

**EP400 + Sylomer**

It is secured to the wall by means of two holes. It has a male M6 metal insert and also an "L" welded nut for securing to the profile.

**EP 600 + Sylomer**

They are secured by two "predrilled" and easy-to-cut pins to facilitate their installation.

**EP 650 + Sylomer**

They are secured by two "predrilled" and bent pins to facilitate their installation.

This principle can be used to make a wide range of variants.

Contact us if you require a product more adapted to your building technique.

## TSR+Sylomer®

### Models and dimensions

#### DESCRIPTION

The AMC-MECANOCAUCHO® TSR type anti-vibration mounts include a microcellular and resilient polyurethane compound for anti-vibration purposes called Sylomer®. This Sylomer® is oil resistant and with a temperature range of -30°C/+70°C. The TSR mounts can be fixed mechanically thanks to the internal nut incorporated to the metallic part that is treated with an antioxidant coat. This coating complies to the RoHs regulations.

The above Chloroprene based rubber that is bonded to the metal acts as an anti-skid surface for those application where a mechanical fixation is not possible to be made. This layer provides an additional anticorrosive protection. In order to match the application, 6 different densities are supplied for a wide range of loads.

## FLOATING FLOOR MOUNTS

### FZH+Sylomer®

#### DESCRIPTION

The goal of the system is to avoid the structure borne noise installing elastical mounts that are embedded in the concrete floating floor. The process of elevation is done once the concrete is dry.

The AMC-MECANOCAUCHO type FZH mounts incorporate a polyurethane elastomer called Sylomer®. This material offers optimal elastic and mechanical properties for the application.

The AMC-MECANOCAUCHO type FZH mounts can be manufactured in different densities of Sylomer to match the natural frequency needed on the application.

The process of leveling is simple and effective. The density of mount per m<sup>2</sup> is 1.12 and the distance between the mounts is 1.2 m.

#### INSTALLATION

## FLOATING FLOOR MOUNTS

### FZH+Sylomer® Range

Type	MAX. LOAD (KG)	Freq (Hz) Max Load	CODE
	<b>140</b>	11	<b>176511</b>
	<b>140</b>	8,6	<b>176512</b>
	<b>240</b>	11,1	<b>176513</b>
	<b>240</b>	8,5	<b>176514</b>

	<b>960</b>	11,7	<b>176519</b>
	<b>960</b>	8,4	<b>176520</b>

#### ADVANTAGES:

- **Lower height of the screed.** Optimum acoustic efficiency without high concrete thickness.
- This floor mount is specially interesting for those rooms who have limited space and can not use a conventional floor mount that increases the height of the floor.
- **Good isolation**, thanks to the antivibration properties of the Sylomer®. Low frequencies can be achieved providing an optimum isolation.
- **Quick installation**, no need to use plywood boards or joints between them.
- **Cost effective**, no need to use plywood boards nor joints.
- **Safe**, acoustic bridges are avoided when levelling the concrete floor.
- **Simple installation**, no specialist installators are needed.

## ACOUSTIC MOUNT

### TLG + Sylomer®: Applications

#### PRODUCT DESCRIPTION

The AMC-MECANOCAUCHO® TLG+Sylomer® anti vibration mounts have been designed to isolate structure borne noise on building applications. Their resilient material is composed of Sylomer® in different densities to suit different load applications.

TLG+Sylomer® anti vibration mounts incorporate interlocking metal component that provide a fail-safe protection. This device limits the ascending vertical movement when the mounting is submitted to shocks at traction.

The anti-corrosive properties of the Aluminum allow this part to be used in outdoor applications.

The Sylomer® polyurethane compound is oil resistant and provide low natural frequencies to avoid noise being transmitted through rigid structures.

#### APPLICATION

The TLG+Sylomer® is often used for the isolation of structure borne noise on frames of car park door frames, as shown on the picture below.

#### INSTALLATION:

The TLG+Sylomer® is often used in very different environments with space limitations. They are installed with standard DIN 6316 clamping elements. As shown on the image below.

Picture of the Mount installed with REF AMC 611533 clamps.

## sylomer® PAD by getzner

### APPLICATIONS

The pieces are made of Sylomer®, which is a very effective material for avoid the transmission of the noise and vibrations thank to its mechanical and elastic proprieties. The microcellular structure provides optimal isolation values with little deflection.

There are available three different Sylomer® densities to ideally suit different required load ranges.

The possibility to cut easily the required piece number according to the load by support makes this product very interesting for all kind of machinery thank to its adaptability.

## PM Sylomer® Polyurethane Supports

### APPLICATIONS

AMC MECANOCAUCHO® has created a new range of Machine Foot mounts for heavy loads. In order to support these heavy weights we use a special mixture of high density polyurethane Sylomer®. Sylomer® offers a better resistance than the synthetic rubbers for oils, solvents, acids and bases.

Type	A (mm.)	B (mm.)	M	LOAD Kg. MIN	LOAD Kg. MAX	Code
PM Sylomer® 70	70	25	M-12	200	950	144101
PM Sylomer® 105	105	27	M-16	500	2500	144102
PM Sylomer® 125	125	30	M-20	2000	4000	144103
PM Sylomer® 165	165	35	M-20	4000	7500	144104
PM Sylomer® 220	220	40	M-24	5000	11500	144105

# ACOUSTIC HANGER PRO

The app that helps you find the correct acoustic hanger

## 1 FILL IN THE INPUT DATA

Indicate if you want to isolate a floor or a ceiling. Then introduce the weight per square meter and distance between hangers/mounts.

Location  
 CEILING    FLOOR

Load  
Kg/m<sup>2</sup>

Distance between points

## 2 SELECT THE PERFORMANCE LEVEL

Introduce the natural frequency that you require. If you ignore this value you can select if your preference is high isolation or cost effectiveness. You can also select if the elastic material is rubber, Sylomer or spring.

Best price   Best isolation

I know the natural frequency

Material  
 RUBBER    SYLOMER    SPRING

**CONTINUE**

## 3 SELECT THE INSTALLATION TYPE

In case that you want to isolate a ceiling, you must indicate if the hanger has to be anchored to the slab, to the metallic beam or between rods. This will provide you a range of selected hangers and mounts that will fulfil your requirement.

## 4 OBTAIN RESULTS

Select the hanger that suits best. This will lead you to a page where you will be able to check the isolation level. On this page you will be able to receive the complete vibration isolation level, data sheet, installation video or even require a quotation/offer.

YOU WILL HAVE ACCESS TO EXTRA CONTENT:

## NEW EXPOSITION TOOLS FOR THE AKUSTIK RANGE OF PRODUCTS

Tacos Sylomer® desktop exposition tool for point of sale areas

Sylomer® PAD desktop exposition tool for point of sale areas

Adapted for show rooms or point of sale areas.

# AMC CATALOGUES

## AMC-MECANOCAUCHO® ANTIVIBRATION MOUNTINGS

Rubber to metal mounts for industrial applications.

## VIBRABSORBER + **sylomer**<sup>®</sup> SPRING MOUNTS

Complete range of spring mounts for industrial acoustics.

## **Granab**<sup>®</sup> Golvregelsystem

Acoustic and technical floor for buildings.

## AKUSTIKABSORBER

Soundproofing composites for industrial applications.

## **sylomer**<sup>®</sup> by getzner

Micro-cellular polyurethane material specially conceived for vibration isolation.

## ACOUSTIC HANGER PRO

Discover the app that helps you **find the correct acoustic hanger** for your application. Let your phone provide you a **full report** of isolation, **datasheets** and **videos** of installation.

**SIMPLE, EASY & FREE!**
