MATERIALS**
AMC MECANOCAUCHO®

AMC
MECANOCAUCHO

MORE THAN 45 YEARS OF EXPERIENCE

Since 1969 **AMC MECANOCAUCHO®** have been designing and manufacturing products for the attenuation of structural borne noise and vibration for a wide range of Industry. In 1990, to compliment the structural borne aspect, AMC began to design and manufacture a range of **AKUSTIKABSORBER®** composites to attenuate Airborne noise.

QUALITY COMMITMENT

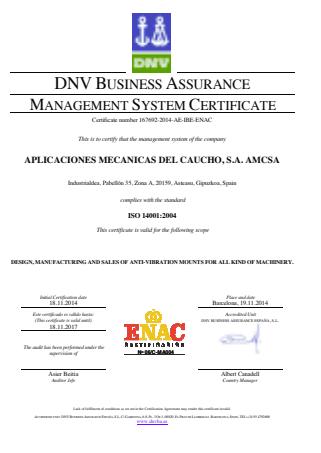

Only the very highest quality raw materials go into the manufacture of **AMC-MECANOCAUCHO®** manufactures high quality products, with state of the art machinery, to produce these effective, high quality composites.

All the products in this catalogue have been tested acoustically at the AMC laboratory; the results of these tests can be seen on each spec sheet.

AMC ENGINEERING

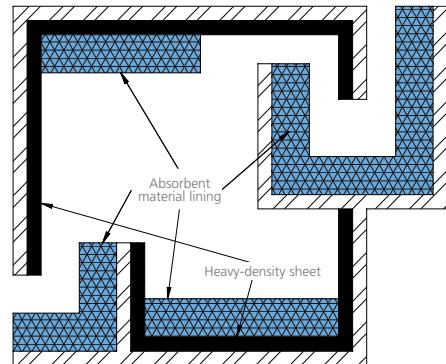

1. APPLICATIONS AND INSTALLATION GUIDE

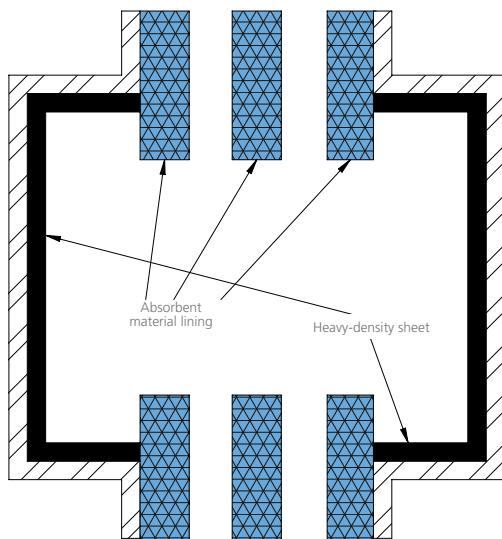

Akustikabsorber products are materials designed to reduce reverberation and increase the attenuation between chambers.

AMC MECANOCAUCHO® provides customers with its vast experience and know how in a wide variety of applications and installations.

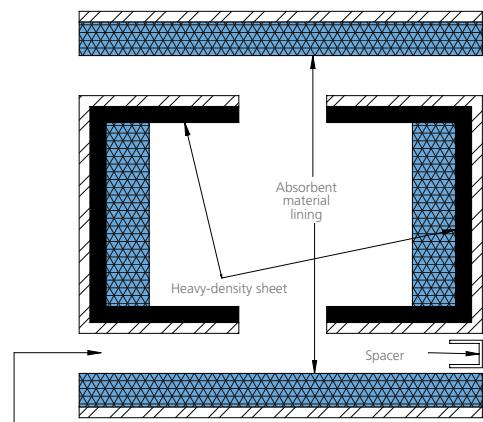

Examples of different cabin executions to reduce noise emission to the exterior while maintaining proper ventilation.

Encapsulated with single or double openings.

Speakers and silencers

Perimeter area equivalent to that of the inputs and outputs of the machine cover.

2. ACOUSTIC CHARACTERISTICS: KUNDT'S TUBE

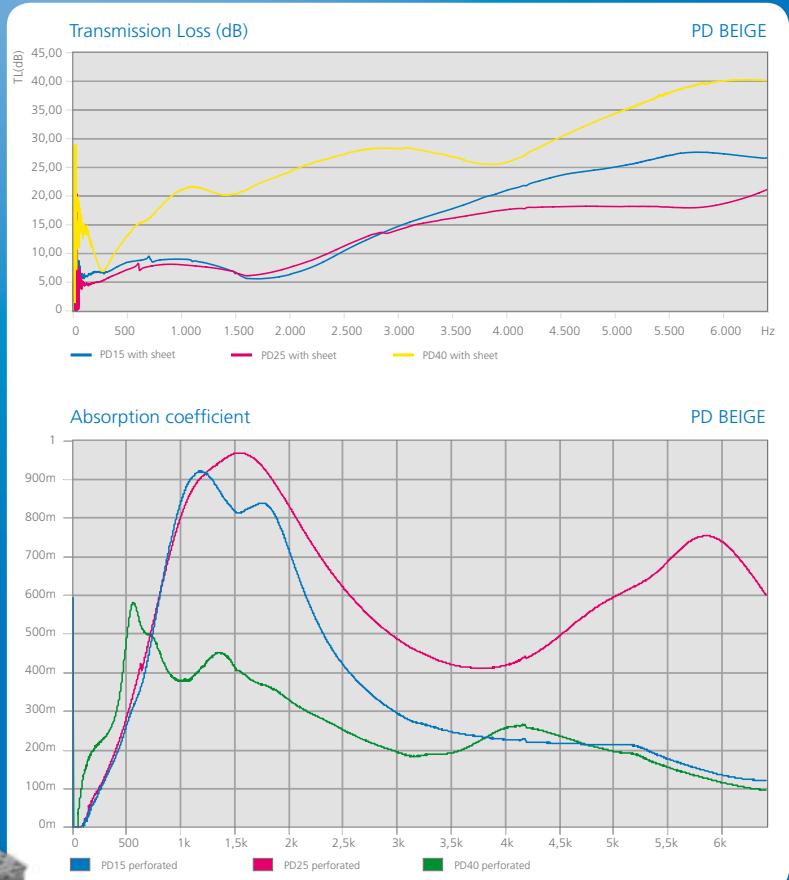

Kundts Tube is very sophisticated standardized test equipment, behaviour in the absorption and isolation against a range of frequencies.

Kundt's tube measures transmission and absorption of a normal perpendicular impact wave.

"If we compare the measurements attained in a reverberating or transmission chamber, the results will always be poorer in Kundt's tube, since all the waves produced in the tube are direct impacts".

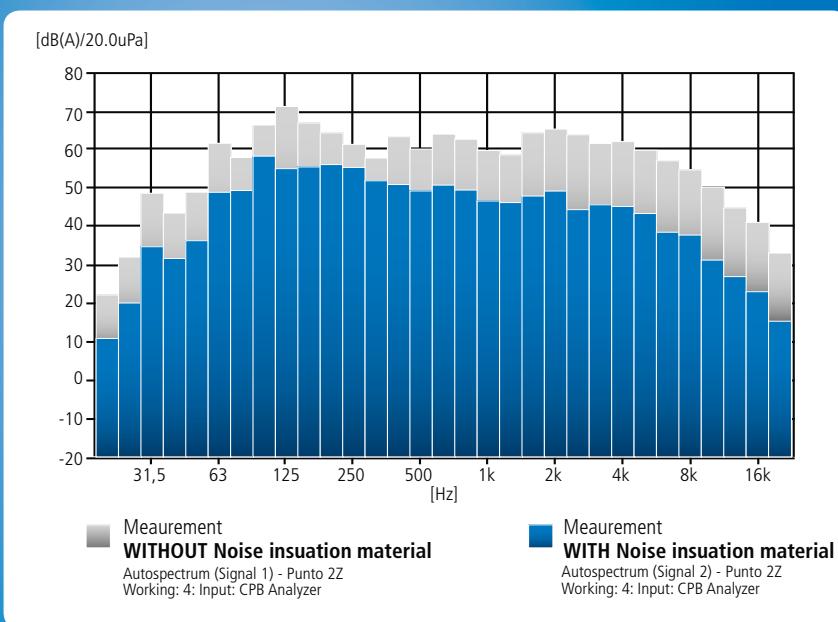

Development of new products:

Knowing our client's specific needs, we develop new akustikabsorber composites. Kundts Tube is very sophisticated standardized test equipment, behaviour in the absorption and isolation against a range of frequencies.

PD BEIGE

3. MEASUREMENTS

To effectively treat noise problems the range of frequencies and sound levels must be identified. With that detailed information calculations can then be carried out to determine the best method and type of composite.

AMC MECANOCAUCHO® applies its experience and know how in measuring and evaluating customers problems to successfully treat their applications by reducing machine produced noise and vibration emissions.

Sound measurement of an industrial machine.

ACOUSTIC KNOWLEDGE

Reverberation time: The reverberation phenomenon is produced as a consequence of the consecutive bouncing of the sound wave on the walls of an enclosure. The reverberation time is the length of time needed for a sound pressure to decay 60dB in the enclosure or cabin.

Basic concepts of acoustics within Industry: When calculating or designing the isolation of a room or a vehicle cabin the following concepts are important.

1.-ABSORPTION: It is of interest to place absorbent materials to reduce the emission

levels of the room, by absorbing part of the interior walls' reflections, the level within will always be less, therefore there is less to isolate.

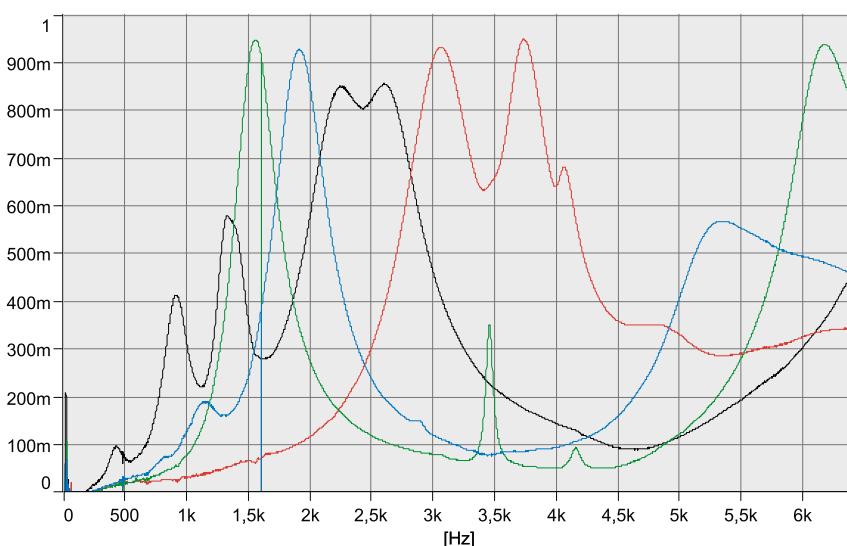

2.-ISOLATION: Mass always plays an important role when isolating a wall, according to the mass law, when mass is doubled the acoustic isolation increases 6dB.

All isolation panels have a critical frequency that depends on the panel's mass and rigidity. The panel's damping coefficient will determine how much the isolation will be reduced at this point, the higher the damping the lower the reduction.

NOISE THERMOMETER

Aluminium facing
with fibreglass
support, M-1 F1
class absorbing
foam and 5 Kg/m²
heavy viscoelastic
mass.

Overall air-borne noise isolation use

- Measurements according to UNE-EN ISO 140-3 standard (December 1995) Acoustic Isolation of Construction Materials in Laboratory Measurements.
- Corresponds completely with ISO 140-3(1995) standard.
- Cancels and substitutes UNE 74-040/3 (1984) standard.
- Calculations according to NBECA88.

Composition

Aluminium facing with fibreglass support, M-1 F1 class absorbing foam and 5 Kg/m² heavy viscoelastic mass.

Applications

Thermal insulation, M-1 class fire-resistant, good resistance to smoke and not very good acoustic absorber but good absorbing isolator with damping layer, which increases the mass and dampens vibrations in marine applications.

Thicknesses

50 mm.

FIXING NAIL + NAUTIC COVER

32 mm.

44 mm.

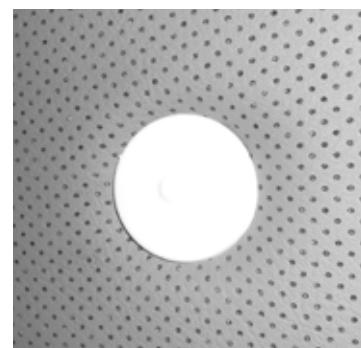

Mechanical fixing systems for our soundproofing materials AKUSTIKABSORBER.

Mechanical fixing systems for our soundproofing materials
AKUSTIKABSORBER.

Installation steps:

1. Simply use a polyurethane sealant, rivets or welding to secure the spikes.
2. On squeezing the adhesive it will seep through, allow it to dry for about 12 hours.
3. Place one nail every 40 or 50 cm and then press the AKUSTIKABSORBER material against the nail evenly.
4. Insert the washer and press against the isolation surface
5. Trim any surplus nail and fit the rubber plug.

RUBBER METAL SUPPORTS

The AMC MECANOCAUCHO® range of anti vibration mounts can solve vibration problems in all types of machinery, mobile or static, thus protecting people and the environment from the harmful effects of noise and vibration. Machinery, which, by virtue of its design has reciprocating or rotating parts, creates vibration to some degree through imbalance of the moving parts. It's necessary an anti vibration mounts because this vibration produced by a machine leads to different problems, such as a reduction in the machine's useful life through part wear, plus the transmission of this vibration to other noninsulated adjacent structures, giving rise to problems of noise and vibration transmission.

VIBRABSORBER + **sylomer**®^{by getzner}

Spring mount is necessary in all machinery, which, by virtue of its design, has reciprocating or rotating parts, creates vibration to some degree through the imbalance of the moving parts. This vibration produced by a machine leads to different problems, such as a reduction in the machine's useful life through part wear, plus the transmission of this vibration to other non-insulated adjacent structures, giving rise to problems of noise and vibration transmission. It is therefore important to install a spring mount to machinery.

OTHER AMC PRODUCTS

AKUSTIK

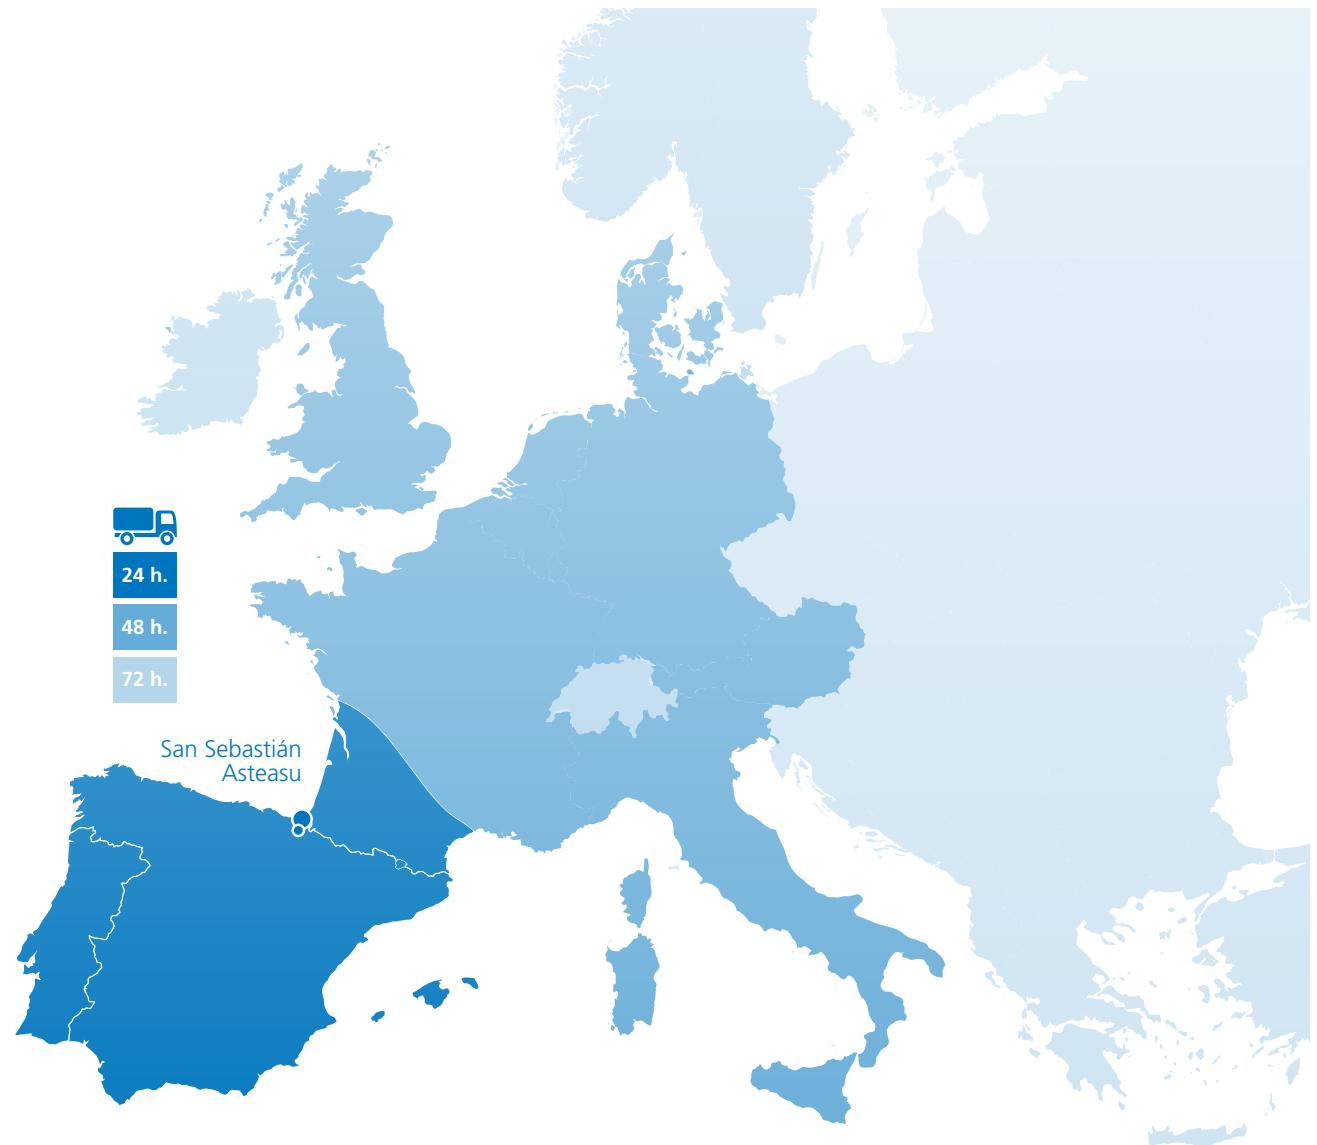

Acoustic hangers are elastic elements used mostly for ceiling suspension in order to achieve vibration and noise insulation. There is a wide range of acoustic hangers, that can be used not only for V ceiling suspension but also for machinery vibration isolation like air conditions units, ventilators, pipe suspension etc. The elastic suspension of different elements in ceilings avoid the propagation of vibration and structural born noise from one floor to the other.

AKUSTIK + sylomer®^{by getzner}

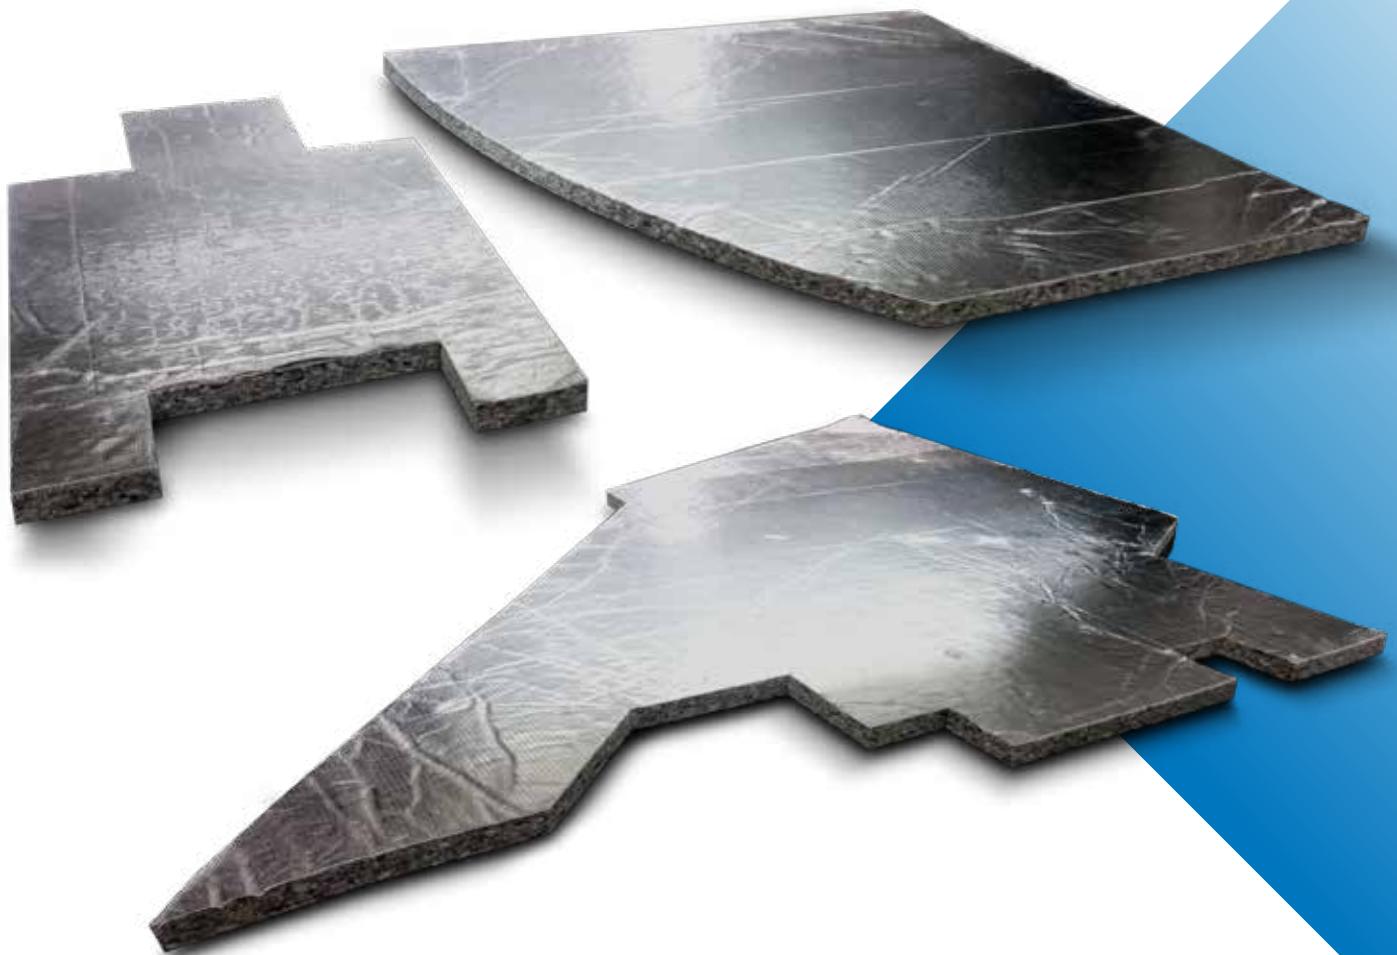

Akustik+Sylomer® is the trademark of a new product range of acoustic hangers. Acoustic suspended ceilings are an excellent way of preventing airborne noise from below passing into the ceiling structure, or preventing noise/vibration from the floor above entering the room below. Sylomer® is a well known elastomer that can give the extra isolation that can make the difference in the acoustic isolation of the room.
